

ITIM

PRACTICAL - 12

Name : Yagna Patel
Enrollment No. : 211621020
Batch : 61(CBA)

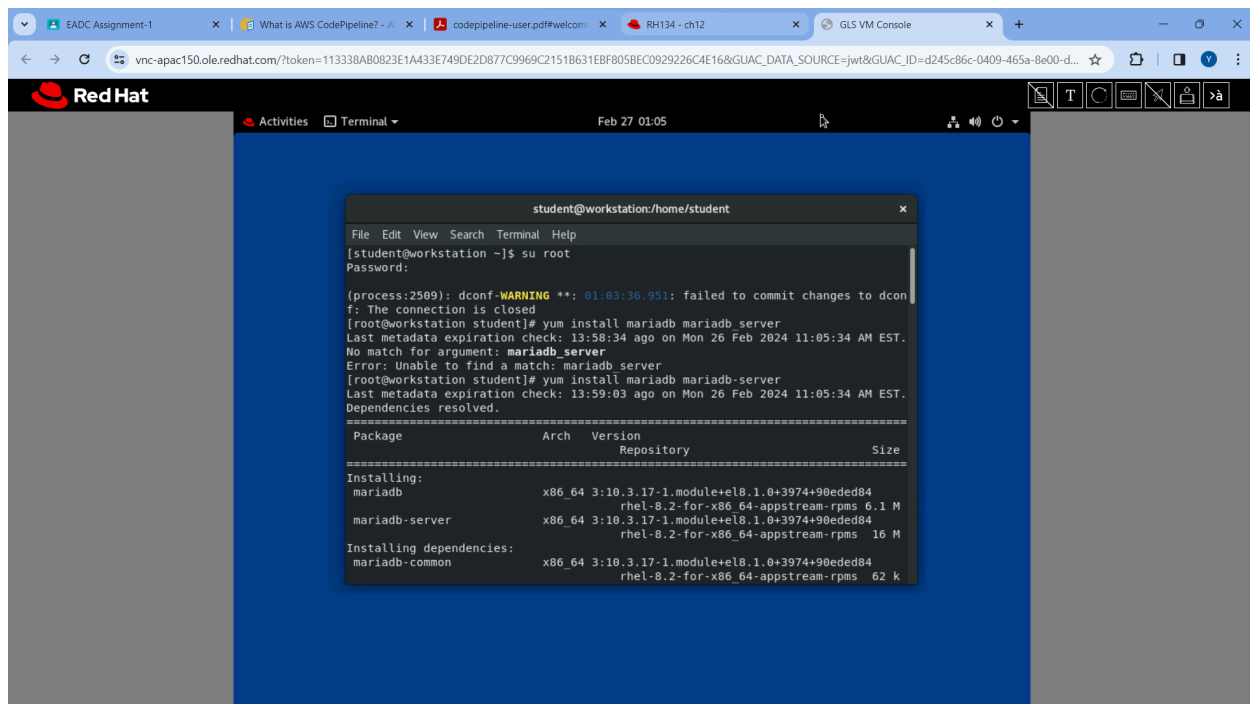

Tasks :

1) Configure MariaDB server on server.example.com with below conditions:

a) Set the root password as "access" and block root access from remote hosts.

Firstly, Install mariadb and mariadb-server using

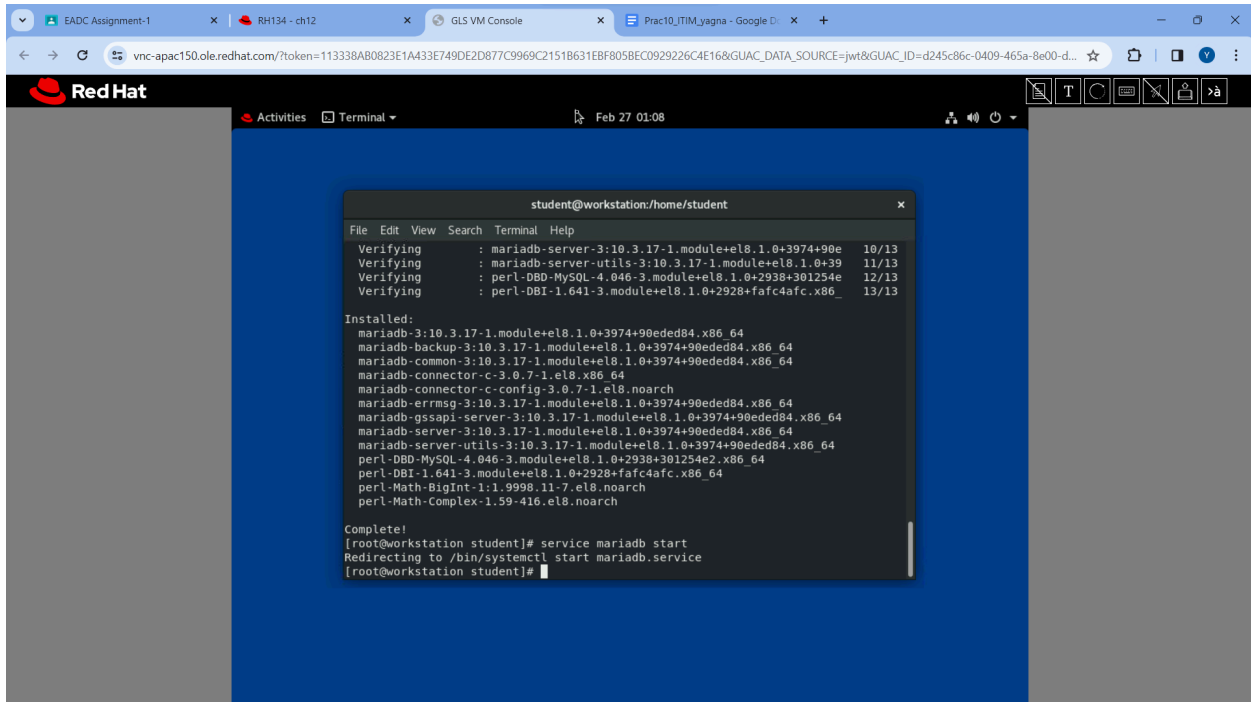

yum install mariadb mariadb-server

The screenshot shows a terminal window titled "student@workstation:/home/student". The user has switched to root and attempted to install mariadb and mariadb-server. The output shows that mariadb-server was not found, but mariadb and mariadb-server were successfully installed along with their dependencies.

```
student@workstation:/home/student
File Edit View Search Terminal Help
[student@workstation ~]$ su root
Password:
(process:2509): dconf-WARNING **: 01:03:36.951: failed to commit changes to dconf: The connection is closed
[root@workstation student]# yum install mariadb mariadb server

=====
```

Start the mariadb service using **service mariadb start**

The screenshot shows a Red Hat VM console window titled "student@workstation/home/student". The terminal output displays the verification and installation of various packages, including mariadb-server, mariadb-server-utils, perl-DBD-MySQL, and perl-DBI. The installation is complete, and the user runs the command `service mariadb start`, which redirects to `/bin/systemctl start mariadb.service`.

Complete!
[root@workstation student]# service mariadb start
Redirecting to /bin/systemctl start mariadb.service
[root@workstation student]#
```

RUN `mysql_secure_installation` to configure mariadb

Further configuration is in d)

```
student@workstation:/home/student
File Edit View Search Terminal Help
Redirecting to /bin/systemctl start mariadb.service
[root@workstation student]# mysql_secure_installation

NOTE: RUNNING ALL PARTS OF THIS SCRIPT IS RECOMMENDED FOR ALL MariaDB
SERVERS IN PRODUCTION USE! PLEASE READ EACH STEP CAREFULLY!

In order to log into MariaDB to secure it, we'll need the current
password for the root user. If you've just installed MariaDB, and
you haven't set the root password yet, the password will be blank,
so you should just press enter here.

Enter current password for root (enter for none):
OK, successfully used password, moving on...

Setting the root password ensures that nobody can log into the MariaDB
root user without the proper authorisation.

Set root password? [Y/n] y
New password:
Re-enter new password:
Password updated successfully!
Reloading privilege tables..
... Success!
```

b) Create a user "yourname" by password "password"

Login into mariadb using

`mysql -u root -p` // -u to give username -p to give password

```
[root@workstation student]# mysql -u root -p
Enter password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 17

+-----+-----+
5 rows in set (0.001 sec)

MariaDB [(none)]> 
```

d) Only local hosts should have access to MariaDB server.

Use `mysql_secure_installation` to enter configuration for mariadb

By default, a MariaDB installation has an anonymous user, allowing anyone to log into MariaDB without having to have a user account created for them. This is intended only for testing, and to make the installation go a bit smoother. You should remove them before moving into a production environment.

Remove anonymous users? [Y/n] y
... Success!

Normally, root should only be allowed to connect from 'localhost'. This ensures that someone cannot guess at the root password from the network.

Disallow root login remotely? [Y/n] y
... Success!

By default, MariaDB comes with a database named 'test' that anyone can access. This is also intended only for testing, and should be removed before moving into a production environment.

Remove test database and access to it? [Y/n] y
- Dropping test database...
... Success!
- Removing privileges on test database...

By default, MariaDB comes with a database named 'test' that anyone can access. This is also intended only for testing, and should be removed before moving into a production environment.

Remove test database and access to it? [Y/n] y
- Dropping test database...
... Success!
- Removing privileges on test database...
... Success!

Reloading the privilege tables will ensure that all changes made so far will take effect immediately.

Reload privilege tables now? [Y/n] y
... Success!

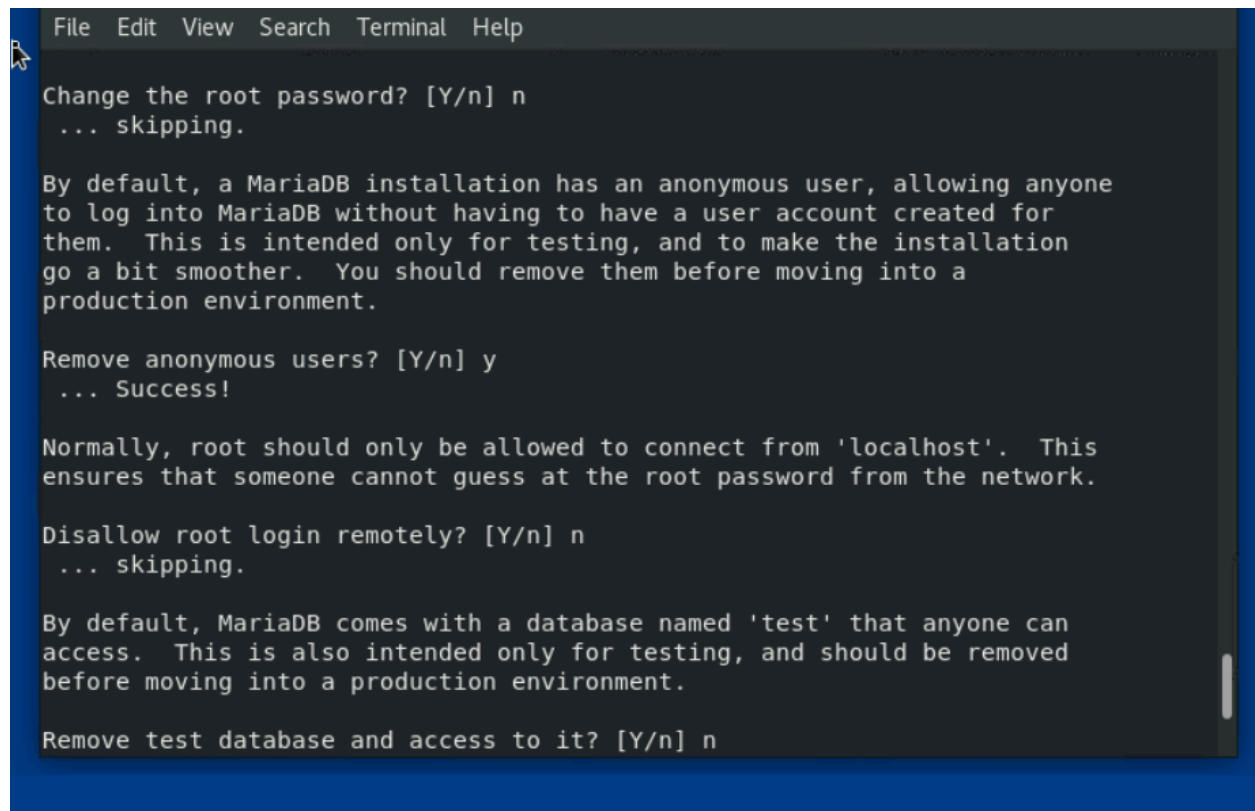

Cleaning up...

All done! If you've completed all of the above steps, your MariaDB installation should now be secure.

Thanks for using MariaDB!
[root@workstation student]#

2) Do the Security setting of the Maria DB and ensure that remote access of the db is enabled and anonymous user access is denied.

RUN **mysql_secure_installation** again to configure mariadb

A screenshot of a terminal window showing the output of the 'mysql_secure_installation' script. The window has a menu bar with 'File', 'Edit', 'View', 'Search', 'Terminal', and 'Help'. The terminal text shows the script asking to change the root password (skipped), explaining the anonymous user, removing anonymous users (successful), explaining root access restrictions, disallowing root login remotely (skipped), explaining the 'test' database, and asking to remove the test database (skipped).

```
File Edit View Search Terminal Help
Change the root password? [Y/n] n
... skipping.

```

3) Create 2 database named - Batch61 and yourname_first4digitofyourenrollemntno. Each database has 3 tables present in it and tables must have atleast 5 entries.

Create db using `create database batch61;`

```
MariaDB [(none)]> create database batch61;
Query OK, 1 row affected (0.001 sec)

MariaDB [(none)]> create database yagna_2116;
Query OK, 1 row affected (0.001 sec)
```

Inserting data using `INSERT INTO table1 VALUES(...),(...);`

And we can read data using **SELECT * FROM table1;**

```
MariaDB [batch61]> create table table1 values(id INT,roll_no INT, name VARCHAR(50));
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds to your MariaDB server version for the right syntax to use near 'values(id INT,roll_no INT, name VARCHAR(50))' at line 1
MariaDB [batch61]> create table table1 (id INT,roll_no INT, name VARCHAR(50));
Query OK, 0 rows affected (0.023 sec)

MariaDB [batch61]> insert into table1 values(1,20,'yagna'),(2,34,'user1'),(3,12,'someguy'),(4,53,'someanotherguy'),(5,89,'anotherone');
Query OK, 5 rows affected (0.013 sec)
Records: 5 Duplicates: 0 Warnings: 0

MariaDB [batch61]> select * from table1;
+-----+-----+-----+
| id | roll_no | name |
+-----+-----+-----+
| 1 | 20 | yagna |

+-----+-----+-----+
| 20 | 21 | yagna |
| 22 | 34 | user1 |
| 32 | 42 | someguy |
| 41 | 53 | someanotherguy |
| 54 | 89 | anotherone |
+-----+-----+-----+
5 rows in set (0.000 sec)
```

```
MariaDB [yagna_2116]> create table table2 (enroll_no INT,marks INT, name VARCHAR(50));
Query OK, 0 rows affected (0.022 sec)

MariaDB [yagna_2116]> insert into table2 values(20,21,'yagna'),(22,34,'user1'),(32,42,'someguy'),(41,53,'someanotherguy'),(54,89,'lastone');
Query OK, 5 rows affected (0.006 sec)
Records: 5 Duplicates: 0 Warnings: 0

MariaDB [yagna_2116]> select * from table2;
+-----+-----+-----+
| enroll_no | marks | name |
+-----+-----+-----+
| 20 | 21 | yagna |
| 22 | 34 | user1 |
| 32 | 42 | someguy |
| 41 | 53 | someanotherguy |
| 54 | 89 | lastone |
+-----+-----+-----+
5 rows in set (0.000 sec)
```

4) One user must be having the access to both the database while another user should have the read access to one database and read and write access to another database.

To grant all privileges to one user using **grant all privileges on *.* to 'yagna'@'localhost' identified by 'password';**

To provide read access to one db: **grant SELECT on batch61.* to 'user1'@'localhost' identified by '@yagna'** and to give write access just add INSERT with select and give the database name.

Here **all privileges** means every privileges, **db_name.table_name** to take entire db **db_name.*** to all dbs *.*; **to user_name@host_name; identified by 'password'** to give password.

```
MariaDB [yagna_2116]> grant all privileges on *.* to 'yagna'@'localhost' identified by 'password';
Query OK, 0 rows affected (0.001 sec)

MariaDB [yagna_2116]> grant select on batch61.* to 'user1'@'localhost' identified by '@yagna';
Query OK, 0 rows affected (0.000 sec)

MariaDB [yagna_2116]> grant select,insert on yagna_2116.* to 'user1'@'localhost' identified by '@yagna';
Query OK, 0 rows affected (0.001 sec)
```

```
[root@workstation student]# mysql -u user1 -p

+-----+-----+-----+-----+-----+
| USER | Select_priv | Insert_priv | Update_priv | Delete_priv |
+-----+-----+-----+-----+-----+
| root | Y           | Y           | Y           | Y           |
| root | Y           | Y           | Y           | Y           |
| root | Y           | Y           | Y           | Y           |
| yagna | Y           | Y           | Y           | Y           |
| user1 | N           | N           | N           | N           |
| user2 | N           | N           | N           | N           |
+-----+-----+-----+-----+-----+
6 rows in set (0.000 sec)
```

7) Demonstrate how to revoke a single permission of a user

To revoke we can use `revoke SELECT on batch61.* from 'user1'@'localhost';`
 //this will revoke select privileges of user1 from all tables of batch61 database

```
MariaDB [(none)]> revoke SELECT on batch61.* from 'user1'@'localhost';
Query OK, 0 rows affected (0.001 sec)
```

8) Set up a default secure MariaDB database called "result" with a user "yourname" with all privileges. In this database, create one simple table with name "students" that allow to store names varchar(20) and their marks int(10). Enter two students with their marks.

Firstly, we will create result database using **create database result;**

Then **use result;** to use the database. **Create table students (name VARCHAR(20),marks INT(10));** to create a table and **INSERT INTO STUDENTS VALUES(...),(...);** to insert values

```
MariaDB [(none)]> create database result;
ERROR 1007 (HY000): Can't create database 'result'; database exists
MariaDB [(none)]> use result;
Database changed
MariaDB [result]> create table students (name VARCHAR(20),marks INT(10));
Query OK, 0 rows affected (0.042 sec)

MariaDB [result]> insert into students values('yagna',53),('user1',35);
Query OK, 2 rows affected (0.014 sec)
Records: 2  Duplicates: 0  Warnings: 0

MariaDB [result]> select * from students;
+-----+-----+
| name  | marks |
+-----+-----+
| yagna |    53 |
| user1 |    35 |
+-----+-----+
2 rows in set (0.008 sec)

MariaDB [result]>
```

9) Demonstrate how to update the records of the table using any user except root user.

To update we can use `update table1 set id=10 where roll_no=20;` // here SET is the new value and we can select the row using WHERE condition; so id set to 10 for roll_no 20.

```
MariaDB [batch61]> update table1 set id=10 where roll_no=20;
Query OK, 1 row affected (0.007 sec)
Rows matched: 1  Changed: 1  Warnings: 0

MariaDB [batch61]> select * from table1;
+-----+-----+-----+
| id    | roll_no | name          |
+-----+-----+-----+
| 10    | 20      | yagna        |
| 2     | 34      | user1        |
| 3     | 12      | someguy      |
| 4     | 53      | someanotherguy |
| 5     | 89      | anotherone   |
| 24    | 131     | tester       |
+-----+-----+-----+
6 rows in set (0.001 sec)

MariaDB [batch61]> show grants;
+-----+
| Grants for yagna@localhost |
+-----+
```

10) Delete the create user

Here we can use drop query : `drop user 'user'@'localhost'` to delete a user.

```
MariaDB [(none)]> drop user 'user2'@'localhost';
Query OK, 0 rows affected (0.001 sec)

MariaDB [(none)]> select USER from mysql.user;
+-----+
| USER |
+-----+
| root  |
| root  |
| root  |
| user1 |
| yagna |
+-----+
5 rows in set (0.001 sec)
```

11) Backup the database with mysqldump to /root/result.dump.

We can perform this task using mysqldump : `mysqldump -u root -p batch61 > /root/result.dump`

Here `-u` is used to specify mariadb user and `-p` to provide password.

Batch61 is the database that we want to backup.

/root/result.dump is the file path where the data will be stored.

```
[root@workstation student]# mysqldump -u root -p batch61 > /root/result.dump
Enter password:
[root@workstation student]# cat /root/result.dump
-- MySQL dump 10.17  Distrib 10.3.17-MariaDB, for Linux (x86_64)
--
-- Host: localhost    Database: batch61
--
-- Server version: 10.3.17-MariaDB

/*!40101 SET @OLD_CHARACTER_SET_CLIENT=@@CHARACTER_SET_CLIENT */;
/*!40101 SET @OLD_CHARACTER_SET_RESULTS=@@CHARACTER_SET_RESULTS */;
/*!40101 SET @OLD_COLLATION_CONNECTION=@@COLLATION_CONNECTION */;
/*!40101 SET NAMES utf8mb4 */;
/*!40103 SET @OLD_TIME_ZONE=@@TIME_ZONE */;
/*!40103 SET TIME_ZONE='+00:00' */;
/*!40014 SET @OLD_UNIQUE_CHECKS=@@UNIQUE_CHECKS, UNIQUE_CHECKS=0 */;
/*!40014 SET @OLD_FOREIGN_KEY_CHECKS=@@FOREIGN_KEY_CHECKS, FOREIGN_KEY_CHECKS=0 */;

/*!40111 SET @OLD_SQL_NOTES=@@SQL_NOTES, SQL_NOTES=0 */;

--
-- Table structure for table `table1`
```

12) Create another user and provide the privilege to just update the information.

To provide update privilege : **grant UPDATE on *.* to 'user3'@'localhost' identified by 'user3';** // so update is provided to user3 on all databases and tables

```
MariaDB [(none)]> create user 'user3'@'localhost' identified by 'user3';
Query OK, 0 rows affected (0.002 sec)

MariaDB [(none)]> grant UPDATE on *.* to 'user3'@'localhost' identified by 'user3';
Query OK, 0 rows affected (0.000 sec)
```

13) Delete the create table, also demonstrate how to perform update operation on the values on the table.

To delete a table : **drop table table1;**

```
Database changed
MariaDB [batch61]> drop table table1;
Query OK, 0 rows affected (0.027 sec)

MariaDB [batch61]> 
```

```
MariaDB [batch61]> update table1 set id=10 where roll_no=20;
Query OK, 1 row affected (0.007 sec)
Rows matched: 1  Changed: 1  Warnings: 0
```

```
MariaDB [batch61]> select * from table1;
```

| id | roll_no | name |
|----|---------|----------------|
| 10 | 20 | yagna |
| 2 | 34 | user1 |
| 3 | 12 | someguy |
| 4 | 53 | someanotherguy |
| 5 | 89 | anotherone |
| 24 | 131 | tester |

```
6 rows in set (0.001 sec)
```

```
MariaDB [batch61]> show grants;
```

```
-----+
| Grants for yagna@localhost
```

14) Demonstrate how to delete the database along with the table present in it.

If we delete a database the table inside will get deleted so, we only need to delete the database.

We can delete it using `drop database yagna_2116;` //here yagna_2116 is the database name which we want to delete.

```
MariaDB [(none)]> drop database yagna_2116;  
Query OK, 3 rows affected (0.064 sec)
```
